Lab 4 Deploying the 'Hello World' Plug-in
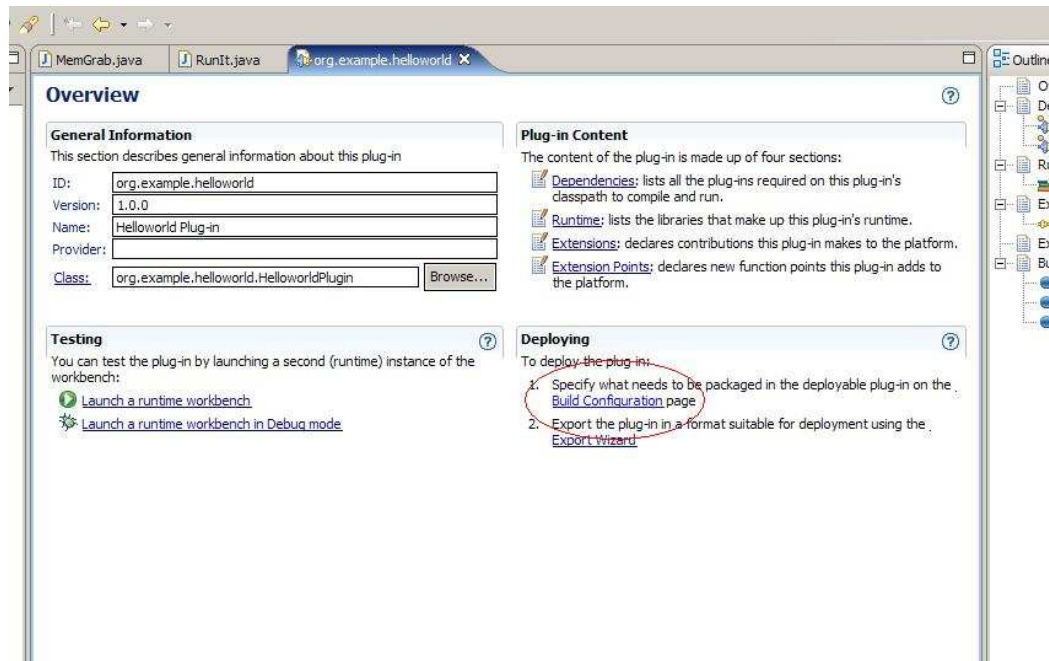

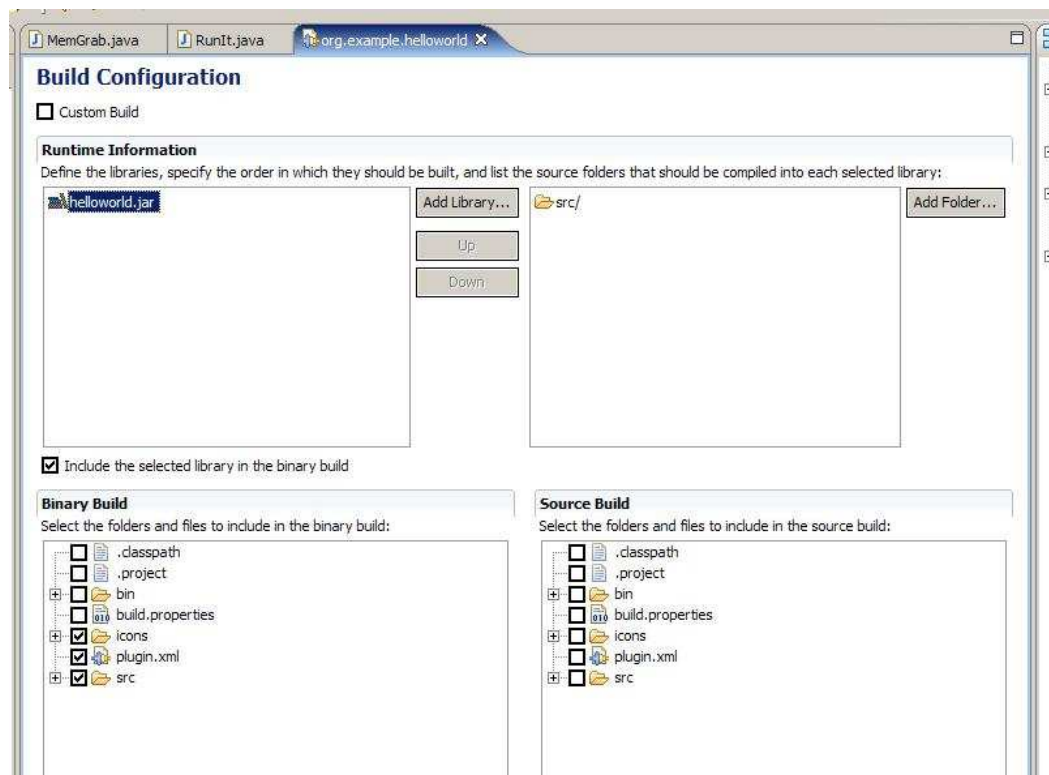

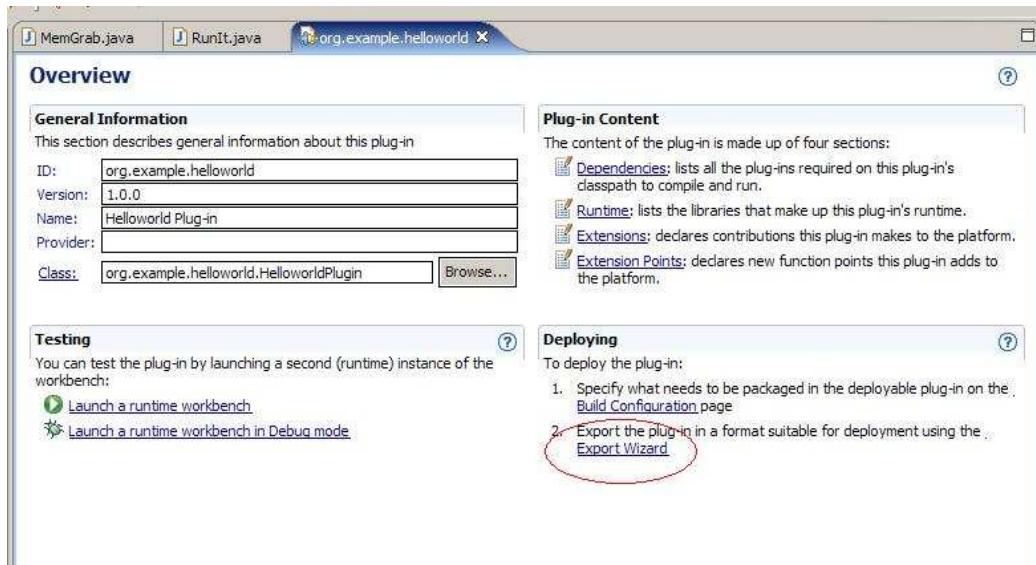

1. Select **'Build Configuration'** from the Overview page;

2. Check **helloworld.jar** file exists, this shows that the automatic build has been successful;
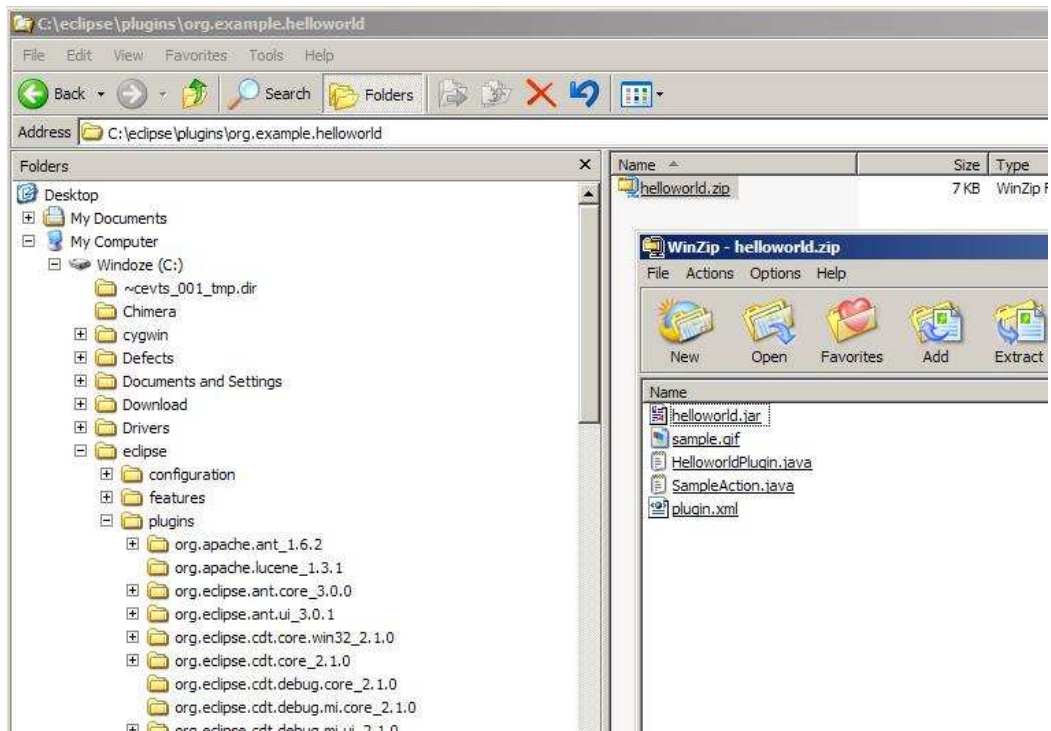

3. Create a directory **org.example.helloworld** in Eclipse's **plugin** directory on your filesystem.

4. Return to the 'Overview' click on the '**Export Wizard'**, we will now export our jar file to the file system as a Zip File.

5. Ensure that the Checkbox is ticked and that you intend to deploy as a single ZIP File.
  You will need to enter a destination (the org.example.helloworld directory we created in step
  3) and filename for the Zip file;

6. After the Export has completed, it's worth taking a look at the resultant Zip file;

7. That's essentially it ! You could try closing your perspectives, and then Eclipse, restarting Eclipse and importing your Hello World Plugin just to familiarize yourself with complete the process.
